🧭 Market Compass: Handover Guide

🔗 Your link

https://aditrikaushik.github.io/Guardian/market-compass/

It works on any phone, tablet or computer, and you can install it as an app:

- **Android (Chrome):** open the link → tap ⬇️ **Install app** at the top, or menu ⋮ → **Install app**.
- **iPhone / iPad (Safari):** open the link → Share button → **Add to Home Screen**.
- 📱 **Android app (APK):** download **https://github.com/AditriKaushik/Guardian/releases/download/market-compass-apk/MarketCompass.apk** on the phone, open the file, and allow "Install unknown apps" for your browser when Android asks. The app shows the live site, so its data is always current. News and NSE links open in your browser. GitHub rebuilds the APK automatically whenever `market-compass/android/` changes.
- **Windows / Mac (Chrome or Edge):** open the link → click the install icon in the address bar, or menu → **Install Market Compass**.

You don't need Claude, a computer that stays on, or any login. Everything runs on GitHub's free service.

All data is real and live: Yahoo Finance for prices, NSE for FII/DII flows and the official index lists. There is no demo or sample data. GitHub Actions rebuilds everything in a **self-refreshing loop**: each run starts the next one itself.

When (IST)	How often
Mon–Fri, 8:45 AM–3:45 PM (market hours)	About every 5 minutes (each price shows its exact time, e.g. "price at 11:30 IST")
Mon–Fri, other times	About every hour (catches the evening FII/DII data and the pre-market moves)
Saturday and Sunday	About every 3 hours

GitHub's own timer (cron) is unreliable, so it is only a backup that restarts the loop if it ever stops. The top of the app shows "data updated ... min ago". During market hours it warns ⚠ **refresh is running late** if the data is more than 15 minutes old. An open app checks for new data every minute. Yahoo's free prices themselves are close to real time (usually within a minute or two).

> ⚠️ Educational tool, not investment advice. No tool can guarantee profits. Always use a stop-loss and never risk money you can't afford to lose.

---

1. What's in the app (8 tabs)

1. 🧭 **Compass:** live tiles for Nifty, Bank Nifty, India VIX, USD/INR, the US Dollar Index, the US 10-year yield, Brent crude, gold, the S&P 500, Nikkei and Hang Seng.
    - A **16-factor scorecard**. 8 factors score themselves from live data (rupee, dollar, US yields, crude, VIX, global markets, Nifty trend, FII flows). You set 8 after reading the news (DII/SIP flows, RBI, inflation, war risk, monsoon, festival demand, earnings, government policy).
    - The result is a **stance for the day** (Aggressive Buy / Cautious Buy / Neutral / Defensive / Protect Capital) and the **sectors to favour or avoid**. Your choices and daily log are saved on your device.
    - 🌍 **Metals, energy & crypto** (also on the Compass tab):
        - Live silver, copper, aluminium, WTI, natural gas, Bitcoin, Ethereum, US VIX and Nasdaq.
        - **"How Nifty should open today"**: a forecast from the overnight S&P 500, the US dollar, Bitcoin and Hang Seng's 7 AM open. It got the direction right on 72–75% of days in 2021–26 tests; the app shows the actual opening next to it.
        - A **metal stocks tilt** from copper, aluminium and Hang Seng.
        - A **cause → effect table** with ✅ / ⚠️ / ❌ verdicts from 10-year tests. Examples:
            - Copper → metal stocks ✅ (small effect)
            - Crude → ONGC ⚠️
            - Gold → Titan ❌
            - Natural gas → GAIL ❌
            - Crypto: adds almost nothing beyond the US market
2. ⭐ **Daily picks:** stocks that pass **every** condition, with a **75%+ historical win rate**. Checks 150 stocks (Nifty 50 + Next 50 + Midcap 50) every refresh.
    - **Rule:** buy a strong stock (above its 200-day average, 50-day above 200-day) on a short dip (below its lower Bollinger Band or RSI(2) under 5), only while Nifty is above its 200-day average. Sell at **+2% target, −8% stop-loss, or after 15 trading days**. Delivery only.
    - **Conditions:**
        - Market-level: market regime, India VIX ≤ 25, macro stance, the rule's own recent win rate ≥ 75%, and FII selling (caution only).
        - Stock-level: no results or board meeting within 3 weeks (NSE event calendar), not in the F&O ban list, not under ASM/GSM surveillance, liquidity ≥ ₹20 cr a day, no circuit-type move, no corporate-action gap, and a sector allowed by the stance.
        - Limits: max 5 picks a day and 2 per industry. Position size risks 1% of your capital.
    - **Real numbers** (recomputed from 10 years of real prices on every refresh, after 0.25% costs): about **81% wins overall and ~80% in the last 5 years**. But wins are small (+2%) and losses big (−6 to −8%). In 2018, 2019 and 2022 it won 75%+ of trades yet lost money overall, and in 2026 so far it is at 69%. The page shows all of this, plus a live record of every final pick.
    - **Stress filters (added after testing):** a pick also needs Nifty lower than 5 trading days ago, India VIX at or above 98% of its 20-day average, and the dip on normal volume (< 1.2× its 20-day average). On unseen 2021–26 data this raised the win rate from 79.7% to **83.8%** and the average per trade from +0.22% to **+0.55%**, better in every year 2017–2026. Picks are now rarer.

    - **Timing:** the list is provisional while the market is open and final after 3:30 PM. The rule enters near the close (3:15–3:25 PM). On many days **no stock qualifies**; that is part of the strategy.
    - Also on the page: Indian rules and regulations (SEBI RA rules, surveillance, T+1 settlement, STT and costs, tax, fraud warnings).
3. 📰 **Overnight news:** everything published between the last NSE close (3:30 PM) and now.
    - **Sources:** Google News searches (India markets, world economy, oil and commodities, geopolitics, RBI), Economic Times, Moneycontrol, Livemint, BBC, CNBC, and NSE corporate announcements for the 150 stocks.
    - **Analysis:**
        - Each headline gets topics (war, Fed, RBI, crude/OPEC, tariffs, China, inflation, rupee, FII, metals, gold, results, Budget, elections, SEBI, monsoon, crypto, tech/AI).
        - Each headline gets a tone for Indian stocks from finance phrases, e.g. "crude jumps" = bad, "rate cut" = good, "ceasefire" = good.
        - Each topic lists the sectors it helps (▲) or hurts (▼). The page also gives an overnight mood.
    - **Company news:**
        - Negative company items block that stock from ⭐ Daily picks. Examples: auditor resignation, default, rating downgrade, pledge invoked, raid or investigation, FDA warning letter, plant shutdown, CFO/CEO resignation.
        - Routine paperwork is filtered out.
    - **Honest note:** research and our own tests agree that overnight news is mostly priced in at the open. So the app saves each morning's mood and compares it with Nifty's real opening and day move. The 🎯 live check shows the hit rate once 5 days are logged.
4. 📈 **Stocks: all 50 Nifty 50 stocks** (NSE's official list, downloaded fresh on every refresh, so index changes appear automatically) plus **20** ⭐ **top performers** picked fresh from Nifty Next 50 and Nifty Midcap 50 by 3-month return (each must also be up over 1 month). Nifty and Bank Nifty are included too. A **Today's movers** table shows the live top gainers and losers. Pick a stock, a horizon (1, 2 or 3 hours, or till close) and your amount in ₹. You get:
    - the **% chance up or down**;
    - **model trust** (how much to believe that %) and its accuracy on unseen history;
    - a likely price range;
    - the quantity to buy, with a stop-loss, a target and the rough expected value;
    - a plain-language reading of the chart, and a chart with Bollinger Bands;
    - a ranked list of the stocks where the model has proven some skill today.
5. 🐋 **Smart money:** FII and DII net buying/selling (NSE), sector rotation (1 day, 5 days, 1 month), and links to NSE's big-player pages: bulk/block deals, option chain, FII positions, insider trades.
6. 📅 **Calendar:** upcoming Indian and US data releases, F&O expiries, your events, and the month's seasonal theme (festivals, monsoon, Budget, results season).
7. 🎯 **Live track record:** the real-world test. Every prediction made in market hours is logged at the live price, then marked ✅ or ❌ against the **actual** price when its horizon ends. It shows the live hit rate against simple guessing, overall and for each horizon. It covers the last 20 days.
8. 📖 **Guide:** install steps, the daily routine, and how to read the numbers.

---

2. Daily routine

Time (IST)	What to do
Evening before	🐋 Smart money: FII/DII flows, bulk/block deals. 📅 Calendar: what's coming this week.
8:00–9:00 AM	🧭 Compass: check the auto scores, then set the ✍️ factors from the morning news. Read the stance and the favoured sectors. Tap **Save today's scorecard**.
9:15–9:45 AM	Don't trade. Let the opening settle.
9:45 AM–2:30 PM	📈 Stocks: look only at stocks in favoured sectors. Act only when **all three agree**: the stance is a Buy, the stock shows **LEANING UP** with **trust ≥ 50%**, and the chart signals are mostly 🟢.
By 3:10 PM	Exit intraday trades. Note what happened.
Weekly	🎯 Live track record: is the model actually beating guessing on real prices?

Reading the numbers honestly

- **"62% chance UP"**: in situations like now, the price rose after your horizon about 62 times in 100. The other 38 times it didn't, so a stop-loss is mandatory.
- **Model trust:** each stock's model is tested on the newest 30% of its history, which it never saw during training. Trust stays low unless it beat both a coin flip and "always guess the most common outcome". Low trust shows as **NO PROVEN EDGE**: don't trade on that number.
- **52–58% accuracy is normal** for intraday moves, even for professionals. Be suspicious of anyone promising 80%.
- **On the first real-data run, most stocks showed no proven edge.** Only about 7–16 of the 52 qualified, depending on the horizon. The app shows this openly. The 🎯 tab is the ongoing proof.
- **Stop-loss / target** are 1× and 1.5× the stock's average hourly range (ATR). The expected value is **before** brokerage, STT, GST and stamp duty, which can wipe out profit on small amounts.
- **Compass blend:** the tick box on the Stocks tab adds at most ±3 points from your daily stance. This is a judgement rule; it hasn't been tested.
- The app **does not** predict overnight gaps or sudden shocks (war, policy surprises, fraud news).

Auto-scoring rules (Compass)

Factor	−1 (bad) when…	+1 (good) when…
USD/INR	rupee falls > 0.5% in 5 days	rupee rises > 0.3%
US Dollar Index	up > 1% in 5 days	down > 1%

Factor	−1 (bad) when…	+1 (good) when…
US 10-year yield	up > 0.15 pts in 5 days	down > 0.15 pts
Brent crude	> $90, or up > 5% in 5 days	< $75 and not rising
India VIX	> 18, or up > 20% in 5 days	< 13
Global markets	US/Japan/HK average last day < −0.7%	> +0.5%
Nifty trend	below its 200-day average	above 50-day average, and 20-day above 50-day
FII flows	net selling > ₹3,000 cr	net buying > ₹1,000 cr

Stance = average of all 16 scores: ≥ +0.40 Aggressive Buy · ≥ +0.13 Cautious Buy · between −0.13 and +0.13 Neutral · ≤ −0.13 Defensive · ≤ −0.40 Protect Capital. You can override any auto score in the app.

---

3. Where everything is

GitHub repository **AditriKaushik/Guardian**, branch `main`, folder `market-compass/` (added in pull request #13).

```

---

4. Making changes (all done on github.com, no software needed)

Open the file on github.com → click the ✏️ pencil → edit → **Commit changes** to `main`. The app republishes itself within a few minutes.

- **Stock list:** updates itself (see `market-compass/compass/universe.py`). To change how many top performers are added, edit `build_universe(n_top=20)`. If NSE's list ever can't be downloaded, a built-in Nifty 50 list (`NIFTY50_FALLBACK`) is used; update it when NSE changes the index (usually March and September).
- **Add events everyone sees:** edit `market-compass/data/events.csv`. One line per event: `2026-12-05,RBI policy decision,India policy,High - banks,` Add RBI MPC dates (rbi.org.in), US Fed FOMC dates (federalreserve.gov) and results dates (NSE announcements). The starter rows marked "verify" should be checked against the official source. Events you add inside the app are saved on that device only.
- **Change scoring thresholds:** `market-compass/compass/scorecard.py`.
- **Change the refresh speed:** the `pause=` values (in seconds) in the `keep-refreshing` job of `.github/workflows/pages.yml`.
- **Force a refresh now:** github.com → repo → **Actions** → **Deploy web app** → **Run workflow**.
- **Nifty expiry day:** the calendar assumes **Tuesday** (NSE's expiry day at the time of writing). If NSE changes it, edit `recurring_events` in `compass/events.py`.

---

5. Using it on another device or account

- **Another phone or computer:** just open the link and install it. Nothing to copy.
- **Your saved settings** (✍️ factor choices, daily log, your own events) are stored in that device's browser. Use **Export log (CSV)** on the Compass tab to keep a copy.

- **Another GitHub account taking over:** fork or transfer the repo. In the new repo:

  1. Enable **Settings → Pages → Source: GitHub Actions**.
  2. Enable **Actions**.
  3. Run **Deploy web app** once from the Actions tab.

  The new link becomes `https://<new-owner>.github.io/<repo-name>/market-compass/`. Also update the HANDOVER link in `web/app.js`.

- **If the refresh ever stops** (for example after a GitHub outage), go to github.com → Actions → **Deploy web app** → **Run workflow**. One click restarts the loop.

---

6. Optional: desktop version (any NSE stock on demand)

The link covers Nifty 50 plus 20 top performers. To analyse **any** NSE symbol live:

1. Download the repo: github.com → **Code → Download ZIP**, then unzip it.
2. Install **Python 3.10+** from https://www.python.org/downloads/. Tick **"Add Python to PATH"**.
3. Open `market-compass` and double-click `Start Market Compass.bat`. On Mac/Linux, run:

   ```
   bash start.sh
   ```

4. The first run installs packages (2–5 minutes). The browser then opens at `http://localhost:8501`. Phones on the same Wi-Fi can open the "Network URL" shown in the window.

You can also host this version free on Streamlit Community Cloud (https://share.streamlit.io): sign in with GitHub and choose repo `AditriKaushik/Guardian`, branch `main`, main file `market-compass/app.py`. NSE often blocks cloud servers, so set the FII factor by hand there.

---

7. Troubleshooting

Problem	Fix
"Could not load live data"	Check your internet and reopen. If it continues, check github.com → Actions for a failed **Deploy web app** run.
"⚠ refresh is running late"	Open github.com → Actions → **Deploy web app** → **Run workflow**. This restarts the refresh loop.
FII/DII missing	NSE sometimes blocks the request. Use the NSE link on the Smart money tab and set the FII factor by hand.
A stock is missing	The web app covers Nifty 50 + 20 top performers. For any other NSE stock, use the desktop version (section 6).
Install button not shown	Use the browser menu → **Install app** / **Add to Home Screen**. iPhone needs Safari.
Prices look a bit late	Free Yahoo data can lag ~15 minutes. Confirm in your broker app before trading.
Check the code works	In `market-compass/`, run `python -m pytest tests -q` (needs internet for the live tests).

---

8. Brief for a developer or AI assistant (copy-paste this)

> I have **Market Compass**, an Indian stock-market dashboard, in the `market-compass/` folder of the public GitHub repo **AditriKaushik/Guardian** (branch `main`). It's published as an installable PWA at https://aditrikaushik.github.io/Guardian/market-compass/.
>
> **How it works:** - `.github/workflows/pages.yml` keeps itself running: its `keep-refreshing` job sleeps, then dispatches the next run (~5 min in market hours, hourly off-hours, 3-hourly at weekends; older loops stop if a newer run exists). Cron entries are only a backup. - It runs `python -m compass.build_site ../_mc_data --previous-track <live track.json URL>`, then publishes `web/` (the repo's other app) at `/` and `market-compass/web/` plus the built `data.json` and `track.json` at `/market-compass/`. If the build fails, the previous JSON is kept.
>
> **Modules (Python, real data only, no demo mode):** - `compass/data.py`: yfinance `history()`, `macro_snapshot()`, `sector_performance()`; NSE `api/fiidiiTradeReact` via `fii_dii()`. - `compass/scorecard.py`: 16 `Factor`s (8 auto-scored, 8 manual), scored −1/0/+1. `stance()` averages them; `sector_tilts()` maps factors to sectors. - `compass/stock_model.py`: hourly bars over 730 days, 15 no-look-ahead features (momentum, VWAP distance, RSI, Bollinger %B, EMA distance/slope, volume ratio, volatility, hour, Nifty move, relative strength) and same-day labels for 1/2/3 hours or till close. - Logistic regression is tested on the newest 30% (chronological, with a gap), then refit on all data. - P(up) is shrunk toward the base rate by a reliability score: AUC-based, and capped at 0.3 unless test accuracy beats always-guess. - `compass/picks.py`: Daily picks. 150 stocks × 10y daily data; rule = uptrend + (close < lower BB or RSI2 < 5) with Nifty > 200DMA; exit +2% / −8% / 15 days; 0.25% costs. Stats recomputed every build. Gates: VIX ≤ 25, auto-stance, rule's 5y win ≥ 75%, NSE event calendar (21 days), F&O ban CSV, NSE ASM/GSM APIs, liquidity, ±8% move, corporate-action gaps, max 5 picks / 2 per industry. Final picks are logged after the close and resolved in track.json → picks. - `compass/universe.py`: all Nifty 50 (NSE's official CSV, with a built-in fallback) + top 20 by 3-month return from Nifty Next 50 / Midcap 50, plus the two indices. - `compass/build_site.py`: about 72 symbols × 4 horizons, plus the live forward-test log (`update_track`). Predictions are logged once per stock/horizon/bar in market hours and resolved against the target bar's real close. Records are kept for 20 days. - `web/app.js`: vanilla JS front end. User judgement scores, the daily log and personal events live in localStorage. The ±3 pt Compass blend and the verdicts are computed client side. - `app.py`: optional Streamlit desktop version for any NSE symbol.
>
> **Tests:** `cd market-compass && python -m pytest tests -q` (logic tests use a synthetic series in `tests/synthetic.py`; `tests/test_live.py` hits real Yahoo data).
>
> **Please keep the honesty rules:** always show model trust, out-of-sample accuracy and the live track record, and never promise returns.

---

9. What was tested (Nov 2026 studies) and what was adopted

Four studies on 10 years of real data. Rules were chosen on data before Nov 2021 and judged only on Nov 2021–Nov 2026.

Study	Adopted	Rejected
Commodities → Indian stocks	Copper/aluminium → metal stocks (small intraday tilt)	Next-day or 5-day prediction from any commodity; gold → Titan; gas → GAIL/IGL; crude → OMCs/IndiGo
Global, crypto, FX → Nifty	Opening-gap forecast (S&P 500, dollar, Hang Seng open, Bitcoin): 72–75% direction	Anything after the open (coin flip); crude, gold, USD/INR for Nifty
Daily Picks filters	Nifty 5-day down + India VIX not falling + calm-dip volume: 83.8% win, +0.55%/trade	US VIX, DXY, USD/INR, crude, copper, BTC, S&P trend, breadth, sector trend, ATR caps
Hourly model + global features	Nothing (no gain over chance)	13 model/feature sets, including pooled and gradient-boosted

Overnight news study (Nov 2026, research summary)

- **Supported by evidence:** macro and world news is absorbed at the open. Company-specific negative news, especially in mid-caps, can drift for days. Examples: auditor resignation, default, downgrade, pledge, FDA warning.
- **Not supported:** headline sentiment predicting Nifty after 9:15, Budget-day direction, or big lasting moves from India–Pakistan tensions, which historically moved the market about 1–2%.
- **What the app does with this:** it uses company news to block risky picks, and it tracks the morning mood against the real open, so its value is measured, not assumed.
